

# LIE: JUST A BLOB OF TISSUE

The scientist Ernst Haeckel (1834-1919) formulated the now-debunked evolutionary theory of Recapitulation. This former theory is a joke to the scientific community, both secular and Christian. It has been well documented and proven scientifically that the beginning of a zygote is fully human; not a fish or a pig or a bird. Ontogeny does not recapitulate phylogeny. When an egg and sperm meet it is fully human. What develops inside of a mother's womb is not an animal. Scientists now believe that what is inside a mother's womb is fully human, but there is a common phrase used among Pro-Choicers to steer away from that and to call it a blob. The phrase is: "Just a Blob of Tissue" and it is made up of these words:

- Just—Commonplace, generalized, irrelevant. By saying "just" it puts in the category of "we don't need this thing. It's something small and insignificant. But is that true?"
- Blob—Amorphous, not human. A blob is nothing. It is without shape, not alive and can certainly be done away with like a booger or a piece of feces, right? But is that true?
- Tissue—Not alive, human-esque. But is that true? Does tissue have heartbeats and brainwaves?

All the words in this phrase are meant to denigrate the fact that it is a living baby and twist people's logic into thinking it is an insignificant, irrelevant, useless thing that is not human. "Just a Blob of Tissue" equals "This insignificant, amorphous, non-alive, non-human blob can be done away with and no one would ever miss it". Scientific facts, however, stand in utter contrast to what the Pro-Choicers want to believe. From the very beginning of a fertilized egg comes a unique human life. A short review of life in the womb may help remind us how unique we are:

- Day 1 – Fertilization; all human chromosomes are present; unique human life begins
- Day 6 – Embryo begins implanting in the uterus
- Day 22 – Heart begins to beat with the child's own blood, often a different type than the mother's
- Week 5 – Eyes, legs, hands begin to develop
- Week 6 – Brain waves detectable; mouth, lips present; fingernails forming
- Week 7 – Eyelids, toes form; nose distinct, baby kicking and swimming
- Week 8 – Every organ in place; bones begin to replace cartilage, fingerprints begin to form
- Weeks 9 to 10 - Teeth begin to form, fingernails develop; baby can turn head, frown
- Week 11 – Baby can grasp objects placed in hand; all organ systems functioning; the baby has fingerprints, a skeletal structure, nerves, and circulation

Science knows that what is inside the womb is a baby; they know it is not a blob. Today's technology, like S4-D ultrasounds, confirm that it is a baby. Pregnant women know that it is a baby, too. So, both science and pregnant women (and plain ol' logic) know that what is inside the womb is a baby.
